The following guidance is intended to assist in the understanding and practical application of the 34th edition of the Standards for Blood Banks and Transfusion Services (BB/TS Standards). The document contains guidance on both the quality concepts that provide the framework for the BB/TS Standards and many of the technical elements contained therein.

It is important to note that the standards in the BB/TS Standards contain the imperative “shall.” Additional information in this document is termed “guidance,” which is intended to serve as helpful advice or to provide examples of how to implement a specific standard; guidance is often characterized by use of the word “should.”

This document includes verbatim requirements from the BB/TS Standards interspersed with guidance. Language from the BB/TS Standards is presented; when there is appropriate guidance for that standard, the guidance language follows the standard with the heading “Guidance.” This format allows the reader to see both the requirement and the associated guidance side by side. Due to the interrelated nature of this guidance document and the BB/TS Standards, readers are encouraged to become familiar with the BB/TS Standards and its format. The Introduction and Preface to the BB/TS Standards contain information that is applicable to this document as well.

Please note that there is no guidance for some standards. The Blood Banks and Transfusion Services Standards Committee has chosen to focus this guidance document on those issues that may require additional context and/or examples to assist in attaining compliance with the BB/TS Standards.
